INSTRUCTION: HOW TO CUT 45deg BAFFLESTEP CHAMFER (Suggestion)

- 1) Adjust the saw to 45deg sawing angle.
- 2) Place a 5..8mm thin guide sheet of MDF or wood (straight cut!) with correct distance. Fix it firmly by clamps. (Test what is best distance and thickness according to your machine setup.)
- 3) Place and fix a second equal workpiece to give the saw equal plane support also on the other side.
- 4) Saw by smooth movement along the guide. Saw each workpiece with same alignment and all pieces in a row, to get same final look to all cuts. (The 45deg angle setting of your saw may be slightly inaccurate in some cases.)
- 5) Smooth the cuts by grinding with sand paper.

(Alternatively you could also cut the 45deg chamfer on the plain front wall, before glue assembly.)

Enjoy! ☺
